JOURNAL OF MACRO-FISCAL LOGISTICS & ENFORCEMENT STRATEGY // VOL. 44, NO. 2

Fiscal Optimization of Dissident Elimination via Quantum Portal Displacement to Heavy-Metal Exoplanetary Environments

Department of Actuarial Enforcement & Resource Allocation, Imperial Directorate

ABSTRACT

Conventional domestic enforcement relies heavily on kinetic ballistics (7.62×51mm cartridge arrays) and bio-sanitation, imposing severe financial and material overhead. This paper presents an actuarial model proving that quantum displacement of non-compliant subjects to Sector-9 (LV-424)—a hyper-thermal exoplanet characterized by continuous liquid lead precipitation ($T = 1,750\text{ K}$)—reduces per-unit suppression cost from **$169.75** to **$0.67**, achieving a cost-efficiency optimization ratio of **252.73×** while completely eliminating metallic munitions consumption.

1. INTRODUCTION & FINANCIAL FRICTION OF KINETIC SUPPRESSION

State security requires total compliance. However, internal pacification via ballistic kinetic execution consumes critical industrial metals (lead, brass, copper) and high-value security manpower (**Directorate Policy Report, 2025**). The total financial cost per subject (C_K) is derived via:

$$C_K = (N_b \times P_b) + C_l + C_p + C_d$$

Where $N_b = 3$ (projectiles per subject), $P_b = \$0.75$ (cartridge unit price), $C_l = \$45.00$ (personnel wage overhead), $C_p = \$12.50$ (logistics/armory), and $C_d = \$110.00$ (sanitation/cremation). Total kinetic cost evaluates to **$169.75 per individual** ($16.97M per 100,000 subjects).

2. QUANTUM DISPLACEMENT MECHANICS & ENERGY EXPENDITURE

By replacing kinetic executions with automated spatial displacement portals (**Vance & Mercer, 2024**), non-compliant subjects are transferred instantaneously to Sector-9. The portal transit cost (C_P) relies exclusively on industrial fusion power grid draw:

$$C_P = [\ (E_{transit} \times P_{kWh}) / \eta\ ] + C_{auto} = [\ (12\text{ kWh} \times \$0.04) / 0.92\ ] + \$0.15 = \mathbf{\$0.67\text{ per subject}}$$

3. COMPARATIVE COST MATRIX

SUPPRESSION STRATEGY	UNIT COST ($ USD)	100K POPULATION OVERHEAD	PRIMARY RESOURCE BOTTLENECK
Standard Kinetic Execution	$169.75	$16,975,000.00	High (Lead, Brass, Manpower)
Indefinite Correctional Incarceration	$48,000.00 / yr	$4,800,000,000.00 / yr	Extreme (Rations, Facility Space)
Sector-9 Portal Displacement	**$0.67**	**$67,170.00**	Negligible (Fusion Grid Flash)

4. ATMOSPHERIC DYNAMICS OF SECTOR-9 (LV-424)

Sector-9 features a surface temperature of 1,750 K (1,477°C) and an atmospheric pressure of 92 atm. At this temperature, atmospheric lead vapor condenses into liquid cloud decks, generating continuous rain consisting of molten lead droplets at a terminal velocity of 85 m/s. The kinetic energy (E_k) delivered by the environment itself fulfills all suppression criteria without state expenditure:

> $E_k = ½ m v^2 = ½ (0.05 kg) (85 m/s)^2 =$ **180.6 Joules per droplet impact**

5. CONCLUSION & POLICY RECOMMENDATION

The state preserves finite industrial lead reserves for defense manufacturing by leveraging LV-424's natural atmosphere. Portal displacement optimizes fiscal efficiency by 25,171% and acts as a psychological deterrent: non-compliant citizens are informed that the State will not spend a single bullet when nature provides infinite free lead.
